

Adaptive Innovation by Recombining Knowledge

Danfeng YUE

Toulouse School of Economics

September 16, 2026

Motivation: Innovation Adjustment to Changing Economic Incentives

Innovation investments are often specific:

- equipment, prototypes, experiments, and engineering effort are often tailored to particular technological applications
- these accumulated investments are therefore either sunk or may lose value outside their original applications

Yet the innovation environment is inherently dynamic:

- technological opportunities, market conditions, and appropriability can change over time

QUESTION:

How do innovators adapt when the returns to these accumulated investments decline?

Motivation: Innovation Adjustment to Changing Economic Incentives

Innovation investments are often specific:

- equipment, prototypes, experiments, and engineering effort are often tailored to particular technological applications
- these accumulated investments are therefore either sunk or may lose value outside their original applications

Yet the innovation environment is inherently dynamic:

Knowledge Recombination as a Margin of Innovation Adjustment

While innovation investments may be specific, the knowledge they generate can be reused in subsequent innovation:

- knowledge generated by prior innovation can serve as knowledge input into subsequent innovation

$$A_1 \longrightarrow A_2$$

The same knowledge can be redeployed in different ways:

- the same knowledge can be combined with different complementary knowledge
- innovators can choose among alternative knowledge combinations

Knowledge Recombination as a Margin of Innovation Adjustment

While innovation investments may be specific, the knowledge they generate can be reused in subsequent innovation:

- knowledge generated by prior innovation can serve as knowledge input into subsequent innovation

$$A_1 \longrightarrow A_2$$

The same knowledge can be redeployed in different ways:

- the same knowledge can be combined with different complementary knowledge
- innovators can choose among alternative knowledge combinations

Knowledge Recombination as a Margin of Innovation Adjustment

Alice: A Shock to the Value of Existing Knowledge

The Alice Decision (2014):

- a U.S. Supreme Court decision on a patent infringement lawsuit ◀ Exogeneity
- tightened patent eligibility for abstract ideas
- disproportionately affected software and business methods (Chien and Wu, 2018)

Why Alice?

- Alice changed the patentability of affected technologies, rather than their technological feasibility
⇒ A shock to the returns to existing knowledge
- The risk of Alice-related rejections varies across technology classes
⇒ Provides cross-sectional variation in exposure to the shock, creating opportunities to adapt through knowledge recombination

Alice: A Shock to the Value of Existing Knowledge

The Alice Decision (2014):

Example: Recombining Knowledge after Alice

CardLogix manufactures smart cards and develops software for the secure transaction and storage of data and value for government.

B: Multimode Connectivity Technology

The technological objective remains the same, while existing security system is recombined with complementary connectivity technology.

Example: Recombining Knowledge after Alice

CardLogix manufactures smart cards and develops software for the secure transaction and storage of data and value for government.

B: Multimode Connectivity Technology

The technological objective remains the same, while existing security system is recombined with complementary connectivity technology.

Example: Recombining Knowledge after Alice

Main Findings

- **Innovators respond to changing incentives through knowledge recombination**
 - ▶ innovations in more exposed technologies combine a broader set of technology classes after Alice
 - ▶ recombination shifts innovation toward less-exposed technological combinations
- **Recombination opportunities shape the extent of adjustment**
 - ▶ the recombination response is stronger when affected technologies have greater opportunities to combine with other technologies
- **Firm technological boundaries shape access to these opportunities**
 - ▶ firms with greater access to recombination opportunities sustain more innovation in affected technologies

Contribution

1. **Knowledge Recombination** (Schumpeter (1934); Weitzman (1998); Henderson and Clark (1990); Fleming (2001); Mumtaz and Fleming (2026))

Recombination as a mechanism to redeploy accumulated knowledge when returns to its original use decline.

2. **Direction of Innovation** (Acemoglu (2002); Aghion et al. (2016); Hopenhayn and Squintani (2021))

Adjustment by changing how accumulated knowledge is used

3. **Investment Irreversibility and Asset Redeployability** (Goel and Ram (2001); Shleifer and Vishny (1992); Kim and Kung (2017))

Knowledge recombination as an internal channel for preserving the value of innovation investment after a shock.

4. **Firms' Technological Scope** (Piscitello (2000); Leten et al. (2007))

A dynamic role for technological scope in shaping firms' ability to recombine and adapt.

Contribution

1. **Knowledge Recombination** (Schumpeter (1934); Weitzman (1998); Henderson and Clark (1990); Fleming (2001); Mumtaz and Fleming (2026))

Recombination as a mechanism to redeploy accumulated knowledge when returns to its original use decline.

2. **Direction of Innovation** (Acemoglu (2002); Aghion et al. (2016); Hopenhayn and Squintani (2021))

Adjustment by changing how accumulated knowledge is used

3. **Investment Irreversibility and Asset Redeployability** (Goel and Ram (2001); Shleifer and Vishny (1992); Kim and Kung (2017))

Knowledge recombination as an internal channel for preserving the value of innovation investment after a shock.

4. **Firms' Technological Scope** (Piscitello (2000); Leten et al. (2007))

A dynamic role for technological scope in shaping firms' ability to recombine and adapt.

Contribution

1. **Knowledge Recombination** (Schumpeter (1934); Weitzman (1998); Henderson and Clark (1990); Fleming (2001); Mumtaz and Fleming (2026))

Alice Exposure

1. Technology-class exposure (a knowledge component): Exposure

$$Exposure_i = Pr(\text{Alice-related rejection} \mid \text{technology class } i)$$

- Estimated using applications **filed before** but **examined after** Alice
 - ▶ technological content was chosen before the decision
 - ▶ examination outcomes reflect the post-Alice eligibility standard

2. Patent exposure (an innovation):

$$Exposure_p = \sum_{i \in p} w_{ip} Exposure_i$$

- weighted exposure across technology classes combined in patent p Weights

3. Firm exposure (an innovator):

$$Exposure_f = \sum_p Exposure_{fp}$$

- $Exposure_{fp}$: the exposure of patent p owned by firm f

Alice Exposure

1. Technology-class exposure (a knowledge component): ◀ Exposure

$$Exposure_i = Pr(\text{Alice-related rejection} \mid \text{technology class } i)$$

- Estimated using applications **filed before** but **examined after** Alice

Recombination Opportunities in the Technology Space

How easily can a focal technology be recombined with other technologies?

⇒ It depends on the local structure of the technology space

Technology Network (pre-Alice):

More and stronger links to other technologies

⇒ Greater recombination opportunities

Measuring Recombination Opportunities:

1. **Relatedness between technology classes:** $R_{ij} = \frac{N_{ij}}{\sqrt{N_i N_j}}$

where N_i is the number of historical patents containing class i , and N_{ij} is the number containing both i and j

2. **Recombination opportunities for technology i :** $RO_i = \sum_{j \neq i} R_{ij}$

Recombination Opportunities in the Technology Space

How easily can a focal technology be recombined with other technologies?

⇒ It depends on the local structure of the technology space

Technology Network (pre-Alice):

Firm Boundaries and Recombination Capacity

Can innovators access the complementary knowledge needed for recombination?

⇒ It depends on the firm's existing technological knowledge

Firm f 's Knowledge Portfolio K_f (pre-Alice):

Measuring Firm Recombination Capacity:

1. Accessible recombination opportunities for firm f in technology i :

$$RO_{fi} = \sum_{j \neq i} R_{ij} \mathbb{I}(j \in K_f)$$

2. Firm-level recombination capacity:

$$RC_f = \sum_i w_{fi} RO_{fi}$$

Firm Boundaries and Recombination Capacity

Can innovators access the complementary knowledge needed for recombination?

⇒ It depends on the firm's existing technological knowledge

Firm f 's Knowledge Portfolio K_f (pre-Alice):

Measuring Firm Recombination Capacity:

1. Accessible recombination opportunities for firm f in technology i :

$$RO_{fi} = \sum_{j \neq i} R_{ij} \mathbb{I}(j \in K_f)$$

2. Firm-level recombination capacity:

Additional Evidence on Knowledge Recombination and Adaptation

Recombination extends beyond technology classifications:

- More exposed technologies draw on more diverse inventor teams ◀ Evidence
- More exposed technologies draw on more diverse knowledge through backward citations ◀ Evidence

Alternative knowledge components: individual patents

- Exposed patents are increasingly cited by less-exposed inventions after Alice ◀ Evidence
- Continuation-in-part filings recombine existing inventions with new knowledge and result in lower Alice exposure ◀ Evidence

Firm adaptation through existing technological knowledge:

- Firms with greater recombination capacity better sustain their technological scope
- Adaptation occurs primarily through reuse of technologies already within firm boundaries ◀ Evidence

Conclusion

Knowledge recombination is a margin of innovation adjustment:

- after Alice, innovations in more exposed technologies combine a broader set of knowledge components and shift toward less-exposed combinations

The scope for recombination depends on technological opportunities:

- the recombination response is stronger when affected technologies have greater opportunities to combine with other technologies

Firm technological boundaries determine access to these opportunities:

- firms with greater access sustain more innovation in affected technologies and experience smaller performance losses

Takeaway: Changes in economic incentives can redirect innovation not only by changing *where* innovators invest, but also by changing *how existing knowledge is combined*.

Conclusion

Knowledge recombination is a margin of innovation adjustment:

- after Alice, innovations in more exposed technologies combine a broader set of knowledge components and shift toward less-exposed combinations

The scope for recombination depends on technological opportunities:

- the recombination response is stronger when affected technologies have greater opportunities to combine with other technologies

Firm technological boundaries determine access to these opportunities:

- firms with greater access sustain more innovation in affected technologies and experience smaller performance losses

Takeaway: Changes in economic incentives can redirect innovation not only by changing *where* innovators invest, but also by changing *how existing knowledge is combined*.

Conclusion

Knowledge recombination is a margin of innovation adjustment:

- after Alice, innovations in more exposed technologies combine a broader set of knowledge components and shift toward less-exposed combinations

The scope for recombination depends on technological opportunities:

- the recombination response is stronger when affected technologies have greater opportunities to combine with other technologies

Firm technological boundaries determine access to these opportunities:

- firms with greater access sustain more innovation in affected technologies and experience smaller performance losses

Takeaway: Changes in economic incentives can redirect innovation not only by changing *where* innovators invest, but also by changing *how existing knowledge is combined*.

Conclusion

Knowledge recombination is a margin of innovation adjustment:

- after Alice, innovations in more exposed technologies combine a broader set of knowledge components and shift toward less-exposed combinations

The scope for recombination depends on technological opportunities:

- the recombination response is stronger when affected technologies have greater opportunities to combine with other technologies

Firm technological boundaries determine access to these opportunities:

- firms with greater access sustain more innovation in affected technologies and experience smaller performance losses

Takeaway: Changes in economic incentives can redirect innovation not only by changing *where* innovators invest, but also by changing *how existing knowledge is combined*.

Immediate Increase in Patent Examination Rejections (High-Exposure Technologies)

CPC Subclasses with High Alice Exposure

CPC Subclass	Short Description	Exposure (%)	
		OLS	GLMM
G06Q	ICT for administrative or business purposes	28.14	34.36
G07F	Coin or payment-operated apparatus	25.25	27.85
G16B	Bioinformatics and computational genomics	18.43	25.91
A63F	Games and amusement devices	20.51	24.81
G16C	Computational chemistry and molecular informatics	14.68	23.08
G07B	Ticketing, fare collection, and access control	18.07	18.06
G09B	Educational or demonstration apparatus	13.16	15.75
G16Z	ICT applied to specific fields	5.63	12.98
G01W	Meteorology-related measurement and forecasting	10.83	10.61
G07G	Registering cash registers, point-of-sale systems, and related devices	3.64	9.77
C12Q	Measuring or testing processes involving enzymes, nucleic acids, or microorganisms	4.87	6.28
G09C	Cryptography and secure communication	3.23	6.10
G01V	Geophysics; detection of underground structures or resources	4.87	5.82
G16H	Healthcare informatics	5.64	5.81
G01C	Measuring distances, navigation, and positioning	4.70	5.65
G10L	Speech analysis, recognition, and processing	4.50	5.42
G07C	Time or attendance registers; time recording devices	3.77	5.33

Weights between Primary and Secondary Classes

$N_{\text{subclasses}}$	$N_{\text{applications}}$ (Share)	OLS Estimates (%)		GLMM Weights (%)	
		Primary	Secondary	Primary	Secondary
1	313,143 (45.18)	118.91	–	100.00	0.00
